

Third and fourth degree tears: advice for opening your bowels

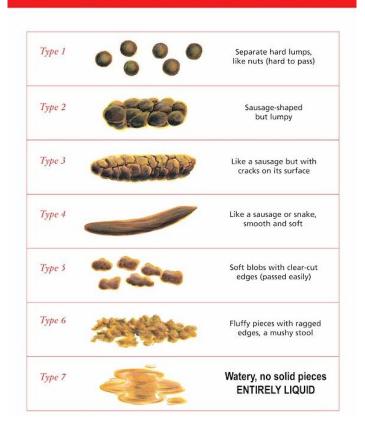

After third and fourth degree tears it is particularly important that you have formed but soft bowel movements (stools). Type 3-4 (see chart below) is the recommended consistency of stool. If your stools are too loose (Type 5-6), they may be difficult to control. If your stools are too hard (Type 1-2), they can be painful and difficult to pass and could potentially cause further damage.

You will be provided with laxatives to help your stools to be soft and easy to pass. We recommend you have a good, varied and healthy diet with plenty of fluid and fibre, including fruit and vegetables.

The diagram overleaf demonstrates the correct position for opening your bowels. It shows the use of a footstool so that your knees are slightly higher than your hips. You may also find it helpful and more comfortable to apply a gentle, upwards pressure externally over the perineum (between the vagina and the back passage), using a pad of toilet paper to support the stitches.

At 10 days after having your baby your midwife will advise you to start weaning off your laxatives, unless she has any concerns about your healing. Once you have been discharged from the midwife, please make an appointment with your GP if you have any concerns about how your tear is healing.

THE BRISTOL STOOL FORM SCALE

Correct position for opening your bowels

Step one

Knees higher than hips

Step two

Lean forwards and put elbows on your knees

Step three

Bulge out your abdomen Straighten your spine

Correct position

Knees higher than hips
Lean forwards and put elbows on your knees
Bulge out your abdomen
Straighten your spine
